sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 // 1.385

```

The likelihood of mammalian fertilisation is decreased by contacting a gamete with a sulphoglycolipid immobilising protein 1 (SLIP1)/ sulphated glyco-moiety interfering composition. The interfering composition is e.g. the heat shock 70kb protein, SLIP1 (or analogues such as the mouse SLIP1 analogue "HSC70B" comprising the amino acid sequence AAR43002) or the 74.5kb mycoplasma protein (AAR43003). Mammalian fertilisation decrease for detecting and treating infertility - using sulpho glyco lipid immobilising protein 1-sulphated-glyco moiety interfering compsn., for mycoplasma infection treatment Claim 2 and Clalim 17; Page 60-62; 77pp; English. Sequence 641 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                 A26283
dhaM-Type molecular chaperone - mouse (fragment)
NALternate names: heat shock protein 68
G.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Accession: A26883
S.Lowe, D.G.; Moran, D.L.A
J. 2102-2112, 1986
A;Title: Molecular cloning and analysis of DNA complementary to three mouse Mr=68,000 he
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: mRNA

"The hsc70 gene which is slightly induced by heat is the main virus
inducible member of the hsp70 gene family.";
FEBS Lett. 355.282-286(1994).

--- FUNCTION: IN COOPERATION WITH OTHER CHAPERONES, HSP70S STABILIZE
PREAKISTENDY PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING
OF NEMLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THE HSP70S IN WITTOCHOWDRIA AND THE ENDOPLASMIC.

RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLOCATION. THEY ARE INVOLVED IN SIGNAL TRANSDUCTION
PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE
PROCESSES THROUGH THEIR ABILLITY TO RECOGNIZE NONNATIVE
CONFORMATIONS OF OTHER PROPEINS. THEY BIND EXTENDED PEPTIDE
SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES
CONFORMATION OF OTHER PROPEINS. THEY BIND EXTENDED PEPTIDE
SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES
CONFORMATION OF OTHER PROPEINS. THEY BIND EXTENDED PEPTIDE
STRESS-INDUCED DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. *Aginactin, an agonist-regulated F-actin capping activity is associated with an HSC70 in Dictyostelium.";

J. Biol. Chem. 268:22367-23274 (1993).

-I. FUNCTION: AFFECTS ACTIN POLYMERIZATION THROUGH INTERACTION WITH THE ACTIN-BINDING PROPEIN CAP32/34. ACTS AS A CHAPERONE BY STIMULATING THE REFOLDING OF DENATURATED CAP32 AND CAP34.

-I. SUBCELLULAR LOCATION: CYTOPLASMIC. FOUND IN F-ACTIN-RICH REGIONS OF THE CELL CORPEX AND CELL PROTRUSIONS.

-I. DEVELOPMENTAL STAGE: HEAT SHOCK COGNATE PROTEINS ARE EXPRESSED CONSTITUTIVELY DURING NORMAL DEVELOPMENT.

-I. SIMILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MSSIGIDLGTTYSCVGVWQNDRVEIIAND -> IHHHINGNATWVVESGPVSEVLSFN (IN REF. 2).

PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILLTY TO RECOGNIZE NONNATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXPENDED PEPTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rattus norvegicus (Rat).

-!- FUNCTION: IN COOPERATION WITH OTHER CHAPERONES, HSP70S STABILIZE PREXISEPRET PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL. AS WITHIN ORGANELLES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILLTY TO RECOGNIZE NONMATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXPONED PEPTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```

```
LENGTH: 99 amino acids
TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein
ORIGINAL SOURCE:
INDIVIDUAL ISOLATE: predicted amino acid coding sequence
US-08-631-328-22 (HuIFNtau6).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    67.4%; Score 31; DB 2; Length 99; 66.7%; Pred. Patent No. 5705363
GENERAL INFORTION:
APPLICANT: Imakawa, Kazuhito
TITLE OF INVENTION: Interferon Tau Compositions and
TITLE OF SEQUENTION: Methods of Use
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             COMPUTER READABLE FORM:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Reference number: JT0285; MUID:88297155
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A. Experimental source: strain 5288C
R. Purnelle; B.; Goffeau, A.
submitted to the EMBL Data Library, April 1996
A. Description: The sequence of 32 kb on the left arm of yeast chromosome XII reveals mily and a new ABC transporter homologous to the human multidrug resistance protein.
A. Reference number: $69380
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A;Description: involved in protein folding and assembling/disassembling of protein C;Superfamily: heat shock protein 70. C;Keywords: ATP; molecular chaperone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Molecule type: DNA

R; Sainls, I.; Angelidis, C.; Pagoulatos, G.; Lazaridis, I.

submitted to the EMBL Data Library, January 1993

A; Description: Nucleotide sequence of the CDNA encoding a monkey 70kd heat shock protein

A; Reference number: S31766

A; Accession: S3176

A; Accession: S3176

A; Molecule type: mRNA

A; Residues: 1-638 <AI>
Fisainis, I.; Angelidis, C.; Pagoulatos, G.; Lazaridis, I.

Fisainis, I.; Angelidis, C.; Pagoulatos, G.; Lazaridis, I.

Fisainis: The hsc70 gene which is slightly induced by heat is the main virus inducible me
